DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with naturally occurring proteolytic fragments are correlated with thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding. MISCELLANEOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-lp(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of proteolytic fragmentation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              structures present in either a mono- or disialylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, NeuMaalpha2-3Galbeta1-3GalMac, with smaller amounts of disialylated and non-sialylated O-glycans also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      decorin.

- I- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS

A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING

EMBRYONIC DEVELOPMENT, TISSUE REMOBELING, TUMOR INVASION,

AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE
GRAAFIAN POLICIES. IT ACTIVATES THE UNCKINASE-TYPE PLASMINOGEN

AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSFONDIN,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -:- ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN: CANNOT BE ACTIVATED WITH STREPTOKINASE.
-:- PTM: N-LINKED GLYCAN CONTAIN N-ACETYLLACTOSAMINE AND STALIC ACID.
O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHARIDE WITH IS
MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICROHETEROGENEITY).
-:- MISCELLAMBOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
-:- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
-:- SIMILARITY: CONTAINS 5 KrINGLE domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble products.

-!- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT. TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAPIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGERASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININA ND VON WHILEBRAND FACTOR.

-!- CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BY SIMILARITY.

stroke, hypotennion; atherosclerosis; heart attack; thrombotic disorder; microvascular occlusion; angiogenic disorder; pulmonary fibrosis; asthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; uterine contraction disorder; respiratory disease; adult respiratory distress syndrome; male impotence.
                                                                                                                                                                                                                                                                                                                           urokinase-type plasminogen activator (upA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell angiogenesis, tumour cell metastrasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, trerine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distease syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) kringle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 60

The invention relates to a composition comprising one or more domains of urckinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           stroke; hypotension; thereselevosis; heart attend, thrombotic disorder; microvascular occlusion; angiogenic disorder; pulmonary fibrosis; asthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; totting disorder; uterine contraction disorder; respiratory disease; adult respiratory distress syndrome; amino terminal fragment; ATF; male impotence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human urokinase-type plasminogen activator amino terminal fragment (ATF).

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microrangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (uPA) amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, urokinase-type plasminogen activator; uPA; therapy; hypertension; stroke; hypotension; atherosclerosis; heart attack; thrombotic disorder; microvascular occlusion; angiogenic disorder; pulmonary fibrosis; asthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; uterine contraction disorder; respiratory disease; adult respiratory distress syndrome; amino terminal fragment; ATF;

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to madulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular coclusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, catabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary Compraction disorder male impotence, respiratory disease or condition associated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) amino

ö
cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P Additionally, N may be used to produce the colon cancer associated Ps, by inserting the mucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Additional diagnosis and AAB77789 represent sequences used in the exemplification of the

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also cencempasses polypeptides 90% identical and polyuacleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens of ovarian antigens, and the use of ovarian polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system of polycypetic ovary syndrome, ovarian cancer and dysmenorrhoea), endocrine of isorders (e.g., infertility, disorders of pregnancy, anovulation, polycypetic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertients (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and vajuntalis), immune disorders (e.g., anaemia), cardiovascular disorders (immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders, neurological disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides and modulate ovarian antigen polypeptides may the modulate ovarian antigen polypeptides may the compounds which the therapy, chromosome mapping, in the contractive or dentification of individuals and in forensic analysis, and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; prourokinase; hPUK; variant; half-life; increase; EGF; epidermal growth factor domain; deletion; thrombolysis; fibrinolysis.
                                                                                                                                                                                                Amino acid residues 1-46 contain the EGF region of human urokinase. Deletion of this region results in a plasminogen activator with reduced affinity for liver cell membranes; the mutant protein is not cleared from the circulation as rapidly as is wild-type tpA. The specification only gives the sequence around the deletion and not the full-length sequence of "delta 1-46 urokinase"; the sequence in AAR68884 has been obtained by amending a previously disclosed wild-type human urokinase sequence (from W09501427) according to the description given in Example 3. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                     New modified plasminogen activator cpds. - having regions removed to reduce affinity for liver membranes and increase circulation half-life.
                                                                                                                                                                                                                                                                                                                                                                   0

New variants of human prounckinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain; (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence represents a specific variant of hPUK which lacks the entire EGF domain; the sequence does not appear in the specification and has been created using the wild-type hPUK sequence and the junction sequence after deflection, both of which are given (in Fig 1 and in Fig 2(3),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          74
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 KTCYEGNGHFYRGKASIDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN

Sequences AAR66244-R66266 are specific examples of such derivs. which have both improved fibrinolytic and thrombin inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26 KTCYEGNGHFYRGKASIDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 85
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New variants of human prourokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain, (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence represents a specific sequence does not appear in the specification and has been created using the wild-type hPUK sequence and the junction sequenc retaited deletion, both of which are given (in Fig 1 and on page 8,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 KTCYEGNGHPYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN

                                                                                                                                                                                                                                                                                                                                                                                                                                             Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AR66244-R66266 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                  /note= "unglycosylated prourokinase(Ser47-Leu411)"
                                        fibrinolysis; thrombin inhibition; thrombolytic; anti-thrombotic;
urokinase; variant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                         New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derivs. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Sequences AAR66544-R66266 are specific examples of such derive, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism to correct PN field.)

                                        M4-XI-YI are claimed (see features table). Sequences AAR66244-R66266 flores specific examples of such derive. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vain thrombosis, cardiac and cerebral infarction and pulmonary embolism.

fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism.

                                                                                                                                                                                                                                                                                                                      Bifunctional urokinase derivatives corresponding to the formula M4-XY1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "unglycosylated prourokinase(Ser47-Leu411)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fibrinolysis; thrombin inhibition; thrombolytic; anti-thrombotic; urokinase; variant; mutein.
                                                                                                                                                                                                                 New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 510; DB 16; Length 392;

                                                                                                                                                                                          Bifunctional urokinase derivatives corresponding to the formula M4-XY1 are claimed (see features table). Sequences AAR6524-R66266 are specific examples of such derivs, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1..365

                                                                                                                                                                                                                                                                                                                                                                    1 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN
                                                                                                                                                                                                                      Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66246 are specific examples of sauch deriva: which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial and pulmonary embolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bifunctional urokinase derivatives corresponding to the formula MA-171 are claimed (see features table). Sequences AR866244-R66266 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction
                                                                                                                                                    1..365

Sequences ARR66244-R866266 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction
                                                                                                                                                                       1.365

```
M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derivs. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction
                                                                                                                                                                       1..365

Sequences AAR66244-R66266 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial

                                                                                                                                                        Bifunctional urokinase derivatives corresponding to the formula M4-XL-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of setting derive, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial and pulmonary embolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "unglycosylated prourokinase(Ser47-Leu411)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fibrinolysis; thrombin inhibition; thrombolytic; anti-thrombotic; urokinase; variant; mutein.
                                  New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc
                                                                                                                                                                                                                                                                                                                                                                                                             Length 393;

                                                                                                                                                                                                                                                                                                          Gaps
                   Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism.

                                                                                                                                                                                                                                                                                                                                                                              Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thrombin, factor Xa; anticoagulant; thrombolytic; plasminogen; urokinase; activator; streptokinase; staphylokinase; APSAC; anisolated plasminogen streptokinase activator complex; hirudin; hirullin; antiscatin; pWL127; pWS1; pSE8; pHWS6.
                                                                                                                                                                                                                                                                                              improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 510; DB 16; Length 393; 100.0%; Pred. Sequences AAR66244.R66266 are specific examples of such derivs, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The protains are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         d
                                                                                                                                                                                                                                                                                         Mare Time Por V; T2 = L or a bond; T3= Q or OH.

(A) is pref. (pro)urokinase; tissue plasminogen activator (tpA),
bat-PA (all opt. modified by deletion, substitution, insertion and/or
addn.); streeptokinase; staphylokinase; and/or APSAC (anisolated
plasminogen streeptokinase activator complex), esp. prourokinase
(411 amino acids) or its Ser47 to Leu411 or Ser138 to Leu411
fragments, or t-PA (527 amino acids) or its Ser89Arg to 527Pro or
144Ser to 527Pro fragments and/or the tick anticoagulant peptide.
(B) has hirudin or hirullin activities; or is derived from the human throughn receptor, antistatin and/or the tick anticoagulant peptide.
Most pref. are the 65 amino acid hirudin sequence or one of the six sequences given in AAR99879 to AAR99888.
Contain the sequences encoding AAR99885 to AAR99884 respectively.
Plasmids pWLT27 (M51), pW31 (M112), pS58 (M36) and pHW56 (M43)
contain the sequences encoding AAR99885 to AAR99888, respectively.
The products were tested in human citrated plasma (5 microg in 200 microl 1:10 diluted plasma). The thrombin time was then 1.2, 3, 2.8
and 1.2 times greater, repectively, than in the absence of the product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
